

Norms of 300 General-Information Questions: Accuracy of Recall, Latency of Recall, and Feeling-of-Knowing Ratings

THOMAS O. NELSON

University of Washington

AND

LOUIS NARENS

University of California, Irvine

Normative data were collected on 300 general-information questions from a wide variety of topics, including history, sports, art, geography, literature, and entertainment. Male and female undergraduates at two different universities made a one-word response to each question either in a response booklet or at a computer console. The reported data include the following for each question: (a) probability of recall for all 270 undergraduates, for males versus females, and for University of Washington subjects versus University of California, Irvine, subjects, (b) latency of correct recall, (c) latency of errors, and (d) feeling-of-knowing ratings for nonrecalled items. Correlations among these dependent variables, along with measures of reliability, are also reported.

Many current investigators are becoming increasingly disenchanted with research on memory for items such as nonsense syllables and instead are becoming more interested in examining memory for the kinds of general information that one encounters in the everyday world (e.g., Freedman & Landauer, 1966; Koriat & Lieblich, 1974; Hart, 1965; Lachman, & Lachman, in press; Squire and Slater, 1975). There are at least two (and probably more) reasons for this shift. First, forceful arguments have been made by Jenkins (1974), Neisser (1976), and others to study memory situations that are more "ecologically valid" (however, also

see Gibbs, 1979). Second, by testing memory for the answer to general-information questions (e.g., "What is the name of the navigation instrument used at sea to plot position by the stars?"), the researcher can investigate retrieval from long-term memory in a single session; this eliminates the necessity of a prior session for acquisition in which the subject learns a list of items as in the previously popular list-learning studies (e.g., Ebbinghaus, 1885). Research on memory for general information (as contrasted with nonsense syllables) has been continually popular in Europe, following the tradition of Bartlett (1932). In North America, however, widespread research on memory for general information has occurred during only the last decade or so.

Although many norms are available on the ease of recall for nonsense syllables (e.g., Glaze's norms), for unrelated words (e.g., Thorndike & Lorge's norms), and for categorized words (e.g., Battig & Montague's norms), currently no norms are available for research on general informa-

This research was supported by U.S. Public Health Service grant MH-32205. Many people contributed substantially to the development of these norms, and special thanks go to Sue Choti, Darnell Malcolm, Antoinette Bryant, Keith Fujioka, Nina Finn, Janice Goldberg, Rich Hakesley, and Laura McCloskey for assisting in the data collection and scoring, and Jerry Kaiwi, Jacob Leonesio, and Art Shimamura for the computer programming.

Requests for reprints should be sent to Thomas O. Nelson, Psychology Department (NI-25), University of Washington, Seattle, WA 98195.

tion. The present project attempted to fill this gap. Our goal was to provide a large set of general-information questions with the following characteristics: (1) They would come from a wide spectrum of topics; (2) they would vary in difficulty in a predictable way so that researchers could select whatever difficulty levels were desired; (3) they would avoid recent topics whose level of recallability might change dramatically over the next few years; (4) they would have relatively unambiguous one-word answers that are fairly easy to spell, at least over the first four letters, so as to be useful for research in which the answers are scored by computer; and (5) they would have levels of relative difficulty that are fairly invariant across different universities. To whatever degree was possible we wanted to provide normative data not only on the probability of correct recall but also on the latency of correct recall, and on both the latency of search termination and the feeling of knowing for nonrecalled answers.

METHOD

Items

The 300 general-information questions were developed from fact books, with the aid of almanacs, atlases, trivia books, friends, and colleagues. All questions pertained to information that was at least 10 years old so as to prevent the normative data from becoming quickly obsolete. The questions covered a wide variety of subjects including sports, geography, entertainment, history, art, and literature. Whenever possible, an attempt was made to have what appeared to the authors to be an easy question and a hard question from the same topic area (e.g., if an easy question such as "What is the capital of France?" was employed, we also selected a harder question on capitals such as "What is the capital of Finland?"). The thought was that future studies of priming and categorical relatedness might find such clusters of questions to be useful. The 300 questions are listed in Table 1.

Subjects and Design

To facilitate the replicability of the relative difficulties of the questions across different universities, one pool of subjects (53 females and 73 males) came from introductory psychology classes at the University of Washington and another pool (71 females and 73 males) came from introductory psychology classes at the University of California, Irvine. All subjects received extra course credit for their participation. We also wanted to maximize the replicability of the relative difficulties across two modes of presentation—questions presented in response booklets versus questions presented via computer—so the Washington subjects answered the questions in response booklets whereas the Irvine subjects answered the questions at computer consoles. The procedure for each of these two pools of subjects will be described separately.

Procedure

University of Washington. The subjects were tested in subgroups of approximately 25 subjects. Each subject was randomly assigned one of five different response booklets, which differed only in terms of the presentation order of the questions (five different random presentation orders were determined without restrictions). The questions appeared in upper-case letters, with 15 questions on each of 20 pages. Next to each question, there was a space for the subject to record his/her answer. The subjects answered the questions at their own rate. The cover page of the booklet contained the following instructions:

This experiment will investigate your knowledge about general kinds of information. We will go through a very large number of general information questions. For each question, PRINT your best guess in the space to the left of the question. The answer will always consist of exactly one word and will never be longer than one word. As each question is presented search your memory hard in an attempt to find the answer to the question. When you have determined the answer there is no need to waste extra time before pro-

ceeding to print it in the space. However, if you do not locate the answer immediately, give yourself a chance to find it by searching your memory a bit more. Some questions may take awhile before you locate the correct answer. The questions vary greatly in difficulty such that you will probably be able to answer some easily while others will be harder, and still others you may not know at all. If, after searching your memory, you are sure that you don't know the answer then print the word "NEXT" and proceed to the next question. Please do not return to (or look back at) any previous question after you have proceeded to the next question. And never leave an answer space blank; for every answer space, either fill in "NEXT" or fill in your best guess. However, there is no penalty for guessing and incorrect answers will not affect your score so be sure to take a guess, if you can, whenever you are unsure. We are only concerned that you get as many questions correct as you possibly can.

Now let's try a practice question. PRINT your best guess in the space to the left of the question:

_____ WHAT IS THE LAST NAME OF
THE CURRENT PRESIDENT OF THE
UNITED STATES?

Now, if you have any questions about the procedure, raise your hand. The experimenter cannot answer any questions once you begin the experiment, so if you have a question you should ask it now.

When you are ready to begin, turn to the first page and start going through the booklet. After you have finished the last question in the booklet, raise your hand to indicate that you have completed the experiment.

After finishing the 300th question, the subjects were dismissed.

University of California, Irvine. The subjects were tested via a PDP11computer. The laboratory had five booths, with each booth containing a television monitor and a typewriter keyboard for responding. The subjects were tested in subgroups of one to five subjects, with a given subject being alone in his or her booth. Each subject received the questions in a different random order. The instructions were identical to those listed above except for additional remarks concerning how to use the typewriter keyboard. The subject was permitted to correct any typographical error before proceeding to the next question.

The time-sharing properties of the com-

puter system were such that response latencies could be determined, but only when no more than one of the five booths was in use. Therefore 43 of the subjects, randomly determined in advance of the session, were tested individually with all remaining booths inactive. Each of these subject's response latencies was recorded in terms of the elapsed time between the onset of the question and the first letter of the subject's answer. The subject was not informed that the response latencies were being recorded, and no emphasis on speed versus accuracy was given except for the remarks in the instructions reported verbatim above. After finishing the 300th question, these subjects gave feeling-of-knowing ratings for all of the items that they had answered incorrectly. The incorrect items were represented in a random order, preceded by the following instructions:

That's the end of the question-answer stage of the experiment. In the next stage we would like you to rate many of the previous items in terms of your "feeling of knowing." That is, for a given item, we would like to see how likely you think you would be to recognize the correct answer. You will give a feeling-of-knowing rating of 1 or 2 or 3 or 4 or 5 or 6 or 7 or 8 or 9 by pressing one of those numbered keys located at the top of the keyboard. If you are completely sure that you know the answer well enough to recognize it then press the "9" key. If you are completely sure that you would not recognize the answer then press the "1" key. When your feeling-of-knowing for the item is somewhere in between, then press one of the intermediate numbered keys by dividing your overall feeling-of-knowing confidence into nine different levels, going from "1" at the lowest level to "9" at the highest level. After you have typed in your feeling-of-knowing rating push the "return" key just once and we will proceed to the next question for your next feeling-of-knowing rating.

After making a feeling-of-knowing rating on every incorrectly recalled item, the subject was dismissed.

RESULTS AND DISCUSSION

The results for each item are shown in Table 1. The 300 items are ordered (and numbered from 1 to 300) in terms of overall accuracy, going from highest overall accu-

racy to lowest overall accuracy. Next to each item number are the question and (in parentheses) the answer that comprise each item, followed by (a) the probability of correct recall for the overall sample of 270 subjects, (b) the probability of correct recall for the 124 female subjects, (c) the probability of correct recall for the 146 male subjects, (d) the probability of correct recall for the 126 University of Washington (UW) subjects, (e) the probability of correct recall for the 144 University of California at Irvine (UCI) subjects, (f) the median latency of correct recall, (g) the median latency of error (i.e., amount of search time before the subject either made an erroneous response or proceeded to the next item), and (h) the median feeling-of-knowing rating if the item had not been correctly recalled.

Overall Accuracy

The probability of correct recall reported in the "All" column in Table 1 shows a good spread across the 300 items, ranging from .974 for the POPEYE item to .000 for the ACONCAGUA item. The distribution is somewhat skewed, with approximately one-third of the items having a probability of correct recall that is greater than .500 and the remaining two-thirds (from item #100 on) having a probability of correct recall that is less than .500. The middlemost item (#150, the HUNGARY item) has a probability of correct recall of .270. In general, there seem to be enough items available at any given level of accuracy that a researcher should be able to select a subset for whatever kind of distribution of item difficulty is desired (e.g., rectangular, unimodal-symmetric, unimodal-skewed). However, two of the items should probably not be employed because of possible ambiguity in the correct response; they are items #57 and #297 (e.g., in #57, for the name of the giant ocean wave, many subjects responded "TSUNAMI" instead of TIDAL, and both are correct).

Sex Differences

While selecting items for inclusion in the norms, no particular attempt was made to

choose items that would (versus would not) have different probabilities of recall across males versus females. Nevertheless, each item was examined for possible sex differences in recall. We employed a conservative alpha level of $p < .001$ for reliability in all inferential statistical tests throughout the study (in part because, as in the present case, a given test was conducted 300 times, once for each item). Table 1 indicates by an asterisk (*) in the "All" column any item that had both a reliable sex difference in the UW sample and a reliable sex difference in the UCI sample (via a binomial test of the difference between two proportions). Such sex differences occurred on only 12 items: #51, 72, 75, 85, 86, 90, 117, 126, 129, 173, 194, and 202. However, an additional 35 items had reliable sex differences in the UCI sample but not in the UW sample (#42, 61, 63, 64, 66, 70, 74, 82, 84, 87, 94, 96, 97, 109, 113, 114, 115, 119, 122, 133, 135, 154, 164, 168, 174, 178, 186, 187, 189, 205, 207, 209, 215, 227, and 231), and an additional 8 items had reliable sex differences in the UW sample but not in the UCI sample (#31, 43, 54, 92, 131, 158, 169, and 190). This illustrates that studies of sex differences should be replicated at different universities to increase the generalizability of the conclusions to "males versus females" (rather than only to "males versus females at university X"). Finally, 14 additional items did not have reliable sex differences in the UW sample and did not have reliable sex differences in the UCI sample but did have reliable sex differences when the data were combined (#10, 46, 48, 53, 59, 67, 80, 81, 93, 98, 160, 188, 234, and 255).

Although the aforementioned sets of items had sex differences in the absolute probability of correct recall, it is important to point out that the relative difficulty across the full set of items is quite similar for males and females. That is, the correlation over the 300 items (in the probability of correct recall for males versus females on each item) is +.933. Thus, one can expect similar results in terms of which items are

TABLE I
PROBABILITY OF RECALL, LATENCY OF RECALL, AND FEELING-OF-KNOWING RATINGS FOR 300 GENERAL-INFO ITEMS

Item number	Item	Probability of recall						Median latency L(C)	Median latency L(E)	Median FOK
		All (N = 270)	Female (N = 124)	Male (N = 146)	UW (N = 126)	UCI (N = 144)				
1	WHAT IS THE NAME OF THE COMIC STRIP CHARACTER WHO EATS SPINACH TO INCREASE HIS STRENGTH? (POPEYE)	.974	.960	.986	.976	.972	.458	—	—	—
2	WHAT IS THE NAME OF THE HORSE-LIKE ANIMAL WITH BLACK AND WHITE STRIPES? (ZEBRA)	.970	.952	.986	.960	.979	5.51	3.08	9	—
3	WHAT IS THE NAME OF THE LONG SLEEP SOME ANIMALS GO THROUGH DURING THE ENTIRE WINTER? (HIBERNATION)	.919	.895	.938	.897	.938	6.33	—	—	—
4	WHAT IS THE LAST NAME OF THE BROTHERS WHO FLEW THE FIRST AIRPLANE AT KITTY HAWK? (WRIGHT)	.919	.895	.938	.905	.931	5.42	—	—	—
5	WHAT WAS THE NAME OF TARZAN'S GIRLFRIEND? (JANE)	.919	.895	.938	.921	.917	3.45	20.36	7	3.5
6	WHAT IS THE CAPITOL OF FRANCE? (PARIS)	.915	.879	.945	.937	.896	3.55	14.38	—	—
7	WHAT IS THE NAME OF THE MOLTEN ROCK THAT RUNS DOWN THE SIDE OF A VOLCANO DURING AN ERUPTION? (LAVA)	.915	.879	.945	.889	.938	6.55	—	—	—
8	WHICH SPORT USES THE TERMS "GUTTER" AND "ALLEY"? (BOWLING)	.896	.871	.918	.905	.889	4.65	12.17	8	—
9	WHAT IS THE NAME OF A DRIED GRAPE? (RAISIN)	.896	.935	.863	.881	.910	4.20	18.06	7	—
10	WHICH SPORT IS ASSOCIATED WITH WIMBLEDON? (TENNIS)	.896	.823	.959	.905	.889	3.80	9.95	1	—
11	WHAT IS THE NAME OF THE CRIME IN WHICH A BUILDING OR PROPERTY IS PURPOSELY SET ON FIRE? (ARSON)	.881	.847	.911	.913	.854	5.88	15.55	7	—
12	WHAT IS THE NAME OF THE LONE RANGER'S INDIAN SIDEKICK? (TONTO)	.870	.831	.904	.865	.875	4.67	10.41	3	—
13	WHICH PRECIOUS GEM IS RED? (RUBY)	.870	.879	.863	.873	.868	4.17	8.06	4	—

14	WHAT IS THE NAME OF AN AIRPLANE WITH- OUT AN ENGINE? (GLIDER)	.856	.790	.911	.873	.840	4.90	11.21	4.5
15	WHAT IS THE NAME OF THE REMAINS OF PLANTS AND ANIMALS THAT ARE FOUND IN STONE? (FOSSILS)	.852	.790	.904	.849	.854	6.44	13.08	3
16	WHAT IS THE NAME OF THE RUBBER OB- JECT THAT IS HIT BACK AND FORTH BY HOCKEY PLAYERS? (PUCK)	.852	.782	.911	.873	.833	5.32	19.43	8
17	WHAT IS THE NAME FOR A MEDICAL DOC- TOR WHO SPECIALIZES IN CUTTING THE BODY? (SURGEON)	.844	.815	.870	.802	.882	6.24	18.85	4.5
18	WHAT IS THE NAME OF AN INABILITY TO SLEEP? (INSOMNIA)	.837	.839	.836	.810	.861	4.04	13.53	6
19	WHAT IS THE NAME OF DOROTHY'S DOG IN "THE WIZARD OF OZ"? (TOTO)	.837	.839	.836	.825	.847	3.77	12.08	7
20	WHAT IS THE LAST NAME OF THE MAN WHO SHOWED THAT LIGHTNING IS ELECTRIC- ITY? (FRANKLIN)	.837	.815	.856	.817	.854	6.07	15.04	9
21	WHAT IS THE NAME OF THE SPEARLIKE OBJECT THAT IS THROWN DURING A TRACK MEET? (JAVELIN)	.833	.758	.897	.833	.833	6.35	9.40	7
22	WHAT IS THE NAME OF THE SHIP THAT CAR- RIED THE PILGRIMS TO AMERICA IN 1620? (MAYFLOWER)	.822	.782	.856	.833	.813	5.08	10.48	8
23	WHAT IS THE LAST NAME OF THE MAN WHO RODE HORSEBACK IN 1775 TO WARN THAT THE BRITISH WERE COMING? (REVERE)	.819	.766	.863	.817	.819	7.34	19.68	8
24	WHAT IS THE TERM FOR HITTING A VOL- LEYBALL DOWN HARD INTO THE OPPO- NENT'S COURT? (SPIKE)	.819	.758	.870	.762	.868	5.20	18.24	7.5
25	WHAT IS THE NAME OF THE SEVERE HEAD- ACHE THAT RETURNS PERIODICALLY AND OFTEN IS ACCOMPANIED BY NAU- SEA? (MIGRAINE)	.807	.839	.781	.754	.854	7.10	13.78	7
26	WHAT IS THE NAME FOR A MEDICAL DOC- TOR WHO SPECIALIZES IN DISEASES OF THE SKIN? (DERMATOLOGIST)	.804	.839	.774	.746	.854	6.15	27.42	8.5
27	WHAT IS THE LAST NAME OF THE SINGER WHO RECORDED "HEARTBREAK HOTEL", AND "ALL SHOOK UP"? (PRESLEY)	.804	.790	.815	.770	.833	7.31	3.60	2

* Item had reliably different probability of recall across males versus females ($p < .001$) for each university.

† Item had reliably different probability of recall across the two universities ($p < .001$).

easier or harder to recall, regardless of whether the subjects are male or female.

University Differences

As Table 1 indicates, only five items differed reliably across the two universities in the absolute probability of correct recall. Items 101, 123, 127, and 141 were easier for the UCI sample than for the UW sample, and item 169 was easier for the UW sample than for the UCI sample.

Even more important, however, the relative difficulty across the 300 items was highly similar for UW subjects versus UCI subjects ($r = +.976$). This conclusion holds both for UW males versus UCI males ($r = +.967$) and for UW females versus UCI females ($r = +.962$). Considering that the UW subjects responded in response booklets while the UCI subjects responded by typing their responses at a computer console, this finding can also be interpreted to mean that the relative difficulty across the 300 items was roughly the same for testing via response booklets versus testing via computer.

Latency Data, Feeling-of-Knowing Ratings, and Relation to Accuracy Data

The latency data and feeling-of-knowing ratings shown in the last three columns of Table 1 come from 43 UCI subjects, as described previously. Although we report all of these data for completeness, the reader should be aware that the reliability varies systematically in the following way. The reliability of the median latency of correct recall, L(C), is directly related to the probability of correct recall because, as that probability increases, the number of items upon which the median L(C) is based will increase. By contrast, the reliability of the median latency of an error, L(E), and the reliability of the median feeling-of-knowing rating, FOK, are inversely related to the probability of correct recall because, as that probability decreases, the number of items upon which the median L(E) and the median FOK are based will increase. For some items near the top of Table 1, none of the 43

subjects made errors and, hence, no median L(E) or median FOK is reported; for some items near the bottom of Table 1, none of the 43 subjects made correct responses and, hence, no median L(C) is reported. One can estimate the number of observations upon which the median L(C) for a given item is based by multiplying that item's probability of correct recall for the UCI sample by 43. Although the result is not an exact estimate—the reported probability of correct recall for the UCI sample is based on all 144 UCI subjects—such an estimate is quite good because the probability of correct recall across the 300 items is highly correlated for the 43 UCI subjects who donated latency-FOK data versus the remaining 101 UCI subjects ($r = +.968$).

Next, consider the correlations among the various dependent variables. A given correlation for any pair of dependent variables is computed over at least 276 items (the number of items can be less than 300 because of missing entries for some items, e.g., 4 items had no median FOK such that the correlation between median FOK and probability of correct recall is computed over 296 items). Although a correlation coefficient obviously should not be interpreted in a causal way, we will offer some brief remarks that might be useful for stimulating more systematic (i.e., experimental) research.

The correlation between L(E) and FOK is $r = +.468$, in accord with the notion that the amount of time passing before the search is terminated is at least partially determined by the feeling of knowing; that is, people search longer for what they think they know than for what they think they do not know (Thompson, 1977; Kokers & Palef, 1976).

The correlation between L(E) and the overall probability of correct recall is $r = +.352$, perhaps suggesting that the amount of search time may be partially determined by what people as a whole know and, hence, what the individual "probably" knows. Such an interpretation might imply a positive correlation between FOK and the

overall probability of correct recall and, indeed, the $r = +.566$ for these two dependent variables (i.e., FOK may be partially based on actuarial considerations). Also, although relatively small in magnitude, the correlation of $r = -.165$ between FOK and L(C) is reliable and perhaps reflects a similar tendency based on actuarial considerations, namely, that the FOK is based partially on one's prediction of how quickly an answer would be retrieved by people who can retrieve it at all.

The correlation between L(E) and L(C) is $r = -.036$, in accord with the notion that these two kinds of latency reflect different psychological processes (Millward, 1964; Nelson & MacLeod, Note 1) and should not be thought of as being interchangeable.

The correlation between L(C) and the probability of correct recall is $r = -.300$. This correlation is in the expected direction (i.e., items that are most likely to be retrieved at all tend to be retrieved faster than other items that are less likely to be retrieved at all). However, the magnitude of this correlation is not very large (e.g., either of these two variables accounts for only 9% of the variance in the other variable, even though the range is quite large in both variables) and might be less than would be predicted by a unidimensional strength theory (cf. Nelson & MacLeod, Note 1; also see Scheirer, 1971).

Scoring

One of the goals of this research was to develop a set of items that could be scored by computer as well as by hand. In the present study, after the UCI responses were scored by computer they were also scored by hand. The computer scoring consisted of counting a response as correct if and only if the first four letters of that response were correct, whereas the hand scoring (shown in the UCI column Table 1) consisted of allowing spelling errors as long as the subject appeared to have the correct response word in mind.

One can inquire about the degree of relationship between these two kinds of scoring. For instance, the computer had to

make a decision concerning the correctness of a given response in order to decide whether or not the item would be presented for a feeling-of-knowing rating. The correlation across the 300 items (from the 43 UCI subjects who went through the FOK phase) for computer scoring versus hand scoring was a very high $r = +.982$. Thus, the two methods of scoring yield essentially the same relative ordering of difficulty for these items.

Another important issue concerns the reliability of hand scoring across different judges. This issue was examined in detail for the UW data, where the use of response booklets rendered scoring by hand almost a practical necessity. Each response booklet was scored independently by two student judges, and any discrepancy in the scoring of a particular response was reconciled by a third student judge. Since there were 126 UW subjects, each of whom each went through 300 items, a total of $126 \times 300 = 37,800$ responses were scored by at least two student judges. Out of these 37,800 responses, there were discrepancies on 573 responses; hence, the probability of a discrepancy was $573 \div 37,800 = .015$ or, put differently, the interjudge reliability in terms of the probability of agreement was $1 - .015 = .985$. Thus, this set of questions appears to have answers that can be scored reliably across different student judges and reliably across computer scoring versus hand scoring.
