Ling 51/Psych 56L: Acquisition of Language

Lecture 14 Lexical development III

Announcements

Be working on HW4 (due 11/7/18)

- Note: Remember that working in a group can be very beneficial.

Be working on the lexical development review questions

From 0 to 50 words

Vocabularies of children with 50 or less words are heavily concentrated on experiences child has: names for people, food, body parts, clothing, animals, household items.

(In general, a lot of nouns = noun bias).

 Braginsky, Yurovsky, Marchman, & Frank 2015: large-scale analysis over tens of thousands of children in English, Spanish, Norwegian, & Danish confirming an "over-representation of nouns" in early vocabularies.

Adults and older children have more variety, including more abstract nouns, as well as other syntactic categories like prepositions (*with*, *from*), determiners (*the*, *a*), and adjectives (*silly*).

The preponderance of nouns

One idea: the meaning of nouns is easier to identify than the meaning of other words, like verbs

give = ?

The preponderance of nouns

How do we test if it's true that the meaning of nouns is easier to learn from observation than the meaning of verbs?

Snedeker, Gleitman, & Brent (1999) asked adult speakers (who are presumably "cognitively mature") to view scenes of what mothers are saying to their children and see which words they could learn.

Experiment with English speakers (Snedeker, Gleitman, and Brent 1999)

Stimuli preparation

 Videotape English speaking mothers playing with their 18- to 24-month-old children

2. Transcribe video tape for mothers' 24 most frequent nouns and 24 most frequent verbs.

3. For each of the most frequent words, randomly select 6 uses of the word.

4. Edit each instance for 40 second clips. Audio was removed and a beep is sounded at instant word uttered.

Subject's Task: Identify the "mystery word" represented by the beep.

Human Simulation Paradigm ("Guess the mystery word")

Percent correct identification in English Snedeker, Gleitman, and Brent (1999)

Nouns seem to be easier... why might that be?

Verb meaning: Linguistic variation

Example of linguistic variation in verb meaning:

English: The goblin fell into the river and then <u>floated down it</u>.

Spanish equivalent:

The goblin fell into the river and then left floating.

El duende cayó en el río y después salió flotando

Verb meaning: Linguistic variation

Example of linguistic variation in verb meaning:

Verb meaning: Linguistic variation

Example of linguistic variation in verb meaning:

Becoming aware of language-specific preferences for verb meaning

Maguire et al. 2010

English and Spanish 2-year-olds seem to show a default preference for encoding direction of motion in a verb (perhaps because path information is more salient).

English and Spanish 5-year-olds seem to show a preference for encoding manner of motion in a verb.

By adulthood, English speakers maintain their preference for encoding the manner of motion in a verb while Spanish speakers recover their initial preference for encoding direction of motion.

Also...

There is some cross-linguistic variation in the preference for nouns over verbs in the early lexicon.

Korean (Kim, McGregor, & Thompson 2000), Japanese, and Mandarin children show less of a noun bias (though there still is something of a noun bias). These languages have several ways of making verb information more salient to learners: verbs appearing sentence-final (very prominent for children), nouns optionally omitted

How might verbs be learned?

Proposal for vocabulary development (Snedeker & Gleitman 2002):

- 1. Learn from Scenes
 - Child relies on situational context alone
 - Can learn only very concrete words: object labels

How might verbs be learned?

Proposal for vocabulary development (Snedeker & Gleitman 2002):

- 1. Learn from Scenes
- 2. Learn from Nouns
 - Object labels provide richer representation of linguistic context
 - Utterance = set of known nouns
 - Child can learn concrete relational words like spatial prepositions (ex: "near") and many verbs

l, it, you

How might verbs be learned?

Proposal for vocabulary development (Snedeker & Gleitman 2002):

- 1. Learn from Scenes
- 2. Learn from Nouns
- 3. Learn from Syntactic Frames
 - Learning relational words allows the child to learn the basic grammar of her language
 - Utterance is represented as a syntactic structure + known words
 - This representation allows the child to learn more abstract words

Can po SIRN while lo nirp nu?

Snedeker & Gleitman (2002)

- Targets
 - Videotaped interactions of 4 mother-child pairs
 - 24 most common **verbs** chosen as targets
 - for each target, 6 instances randomly selected
- Subjects participated in one of 7 Information Conditions
 - Scenes
 - Nouns
 - Frames
 - Scenes + Nouns
 - Scenes + Frames
 - Nouns + Frames
 - Scenes + Nouns + Frames

Scenes condition

Example "mystery verb": "play"

On to next mystery verb

Nouns condition

Example "mystery verb": "play"

On to next mystery verb

Frames condition

Example "mystery verb": "play"

1. Can kax SIRN the bussit? Guess word. 2. Noggle SIRN? **Guess word again.** 3. Can po SIRN while lo nirp nu? **Guess word again.** 4. Lo are gonna SIRN nu? **Guess word again.** Task: Subjects guess the 5. SIRN the neps. mystery verb from the 6 Guess word again. sentence frames. The 6. Lo SIRN tuggy wilm. sentence frames are constructed by replacing words in the 6 utterances **Final guess** with nonsense words.

On to next mystery verb

Correct identification varies with information condition

Correct identification varies with information condition

Correct identification varies with information condition

Utility of syntactic frame knowledge: Scenes + Nouns equivalent to Syntactic Frames only

Utility of additional knowledge with Frames: Scenes + Frames equivalent to Nouns + Frames which is better than Frames alone

Superiority of using all the available information: Scenes + Nouns + Frames is better than all other information type combinations

So Snedeker & Gleitman (2002) have shown that maybe learning verbs isn't so bad once you have some linguistic background (like knowing some nouns and some syntactic frames) and informative situational context (scenes)

Let's look more at clues from the input

Knowing what to guess

Clues from the input

19-month-olds can use known words (like "crying") to figure out unknown words.

Ferguson, Graf, & Waxman 2014

Sample test scenario, where only animate things can cry

Knowing what to guess

Clues from the input: what you know helps you learn new things

Ferguson, Graf, & Waxman 2018: At both 19 and 24 months, the number of verbs infants know predicts their ability to use known verbs to learn novel nouns.

Knowing what to guess [Extra]

Clues from the input

Speakers also sometimes provide explicit correction for meaning, and provide additional information about the word's meaning.

"Can I see the bugs again?"

"Those are goblins, honey, not bugs. Goblins live in the Labyrinth and occasionally take naughty children away."

Knowing what to guess

Clues from the syntactic structure

Different grammatical categories (nouns, verb, etc.) tend to have different meanings. Once children have identified some syntactic categories (after ~14 months), they can use the syntactic structure (how words appear together) as a clue to meaning.

"Those are <u>goblins</u>." goblins = noun nouns = objects goblins =

Using syntactic structure

http://www.thelingspace.com/episode-35 https://www.youtube.com/watch?v=Ci-5dVVvf0U 5:07 - 6:19

Knowing what to guess

Knowing what to guess

Clues from the syntactic structure

Clues from the syntactic structure

Clues from the syntactic structure

Bernard et al. 2007: 23-month-olds are able to do the same thing.

Clues from the syntactic structure

Bernard et al. 2007: 23-month-olds are able to do the same thing.

Clues from the syntactic structure

Syrett, Arunachalam, & Waxman 2014: 27-month-olds can use adverbs like "slowly" to focus on the parts of the observed event that matter for verb meaning.

Clues from the syntactic structure

Klein & Snedeker 2015: 2-year-olds can use the words surrounding a verb to determine what kind of action it encodes

Clues from the syntactic structure

Klein & Snedeker 2015: 2-year-olds can use the words surrounding a verb to determine what kind of action it encodes

Clues from the syntactic structure

He & Lidz 2017: 18-month-olds can use the word and word parts surrounding a verb to determine what kind of action it encodes

Clues from the syntactic structure

Kedar, Casasola, Lust, & Parmet 2017: 18-month-olds can use determiners like *the* to figure out the next word should have a referent (and so be a noun). Some of this sensitivity is already present at 12 months old.

Can you see the ball?

Clues from the syntactic structure

Paquette-Smith & Johnson 2016: 2-year-olds already rely on some grammatical cues more than eye gaze in cases of ambiguity.

During training, the speaker looks at a different referent than what the grammatical cues indicate.

Clues from the syntactic structure

Paquette-Smith & Johnson 2016: 2-year-olds already rely on some grammatical cues more than eye gaze in cases of ambiguity.

Clues from the syntactic structure

Paquette-Smith & Johnson 2016: 2-year-olds already rely on some grammatical cues more than eye gaze in cases of ambiguity.

We can see this because they look to the correct referent when we test them afterwards (and the grammatical cues are again present).

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Naigles (1990): 2-year-olds can use syntactic structure to guess aspects of word meaning, including the difference between transitive and intransitive verbs

Transitive: The rabbit is gorping the duck.

(expectation: rabbit is doing something to the duck)

Intransitive: The rabbit and the duck are gorping. (expectation: rabbit and duck doing actions separately)

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Yuan & Fisher (2009), Scott & Fisher (2009), Messenger, Yuan, & Fisher (2015): 2-year-olds can keep track of the syntactic structures in which a verb appears and use that to infer a verb's meaning.

Transitive dialogue A: Guess what? Jane blicked the baby! B: Hmm. She blicked the baby? A: And Bill was blicking the duck. B: Yeah, he was blicking the duck.

Intransitive dialogue

Example verb: sneeze

Example verb: kiss

- A: Guess what? Jane blicked!
- B: Hmm. She blicked?
- A: And Bill was blicking .
- B: Yeah, he was blicking.

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Yuan & Fisher (2009), Scott & Fisher (2009), Messenger, Yuan, & Fisher (2015): 2-year-olds can keep track of the syntactic structures in which a verb appears and use that to infer a verb's meaning.

Causal dialogue Example verb: melt A: Matt dacked the pillow. B: Really? He dacked the pillow? A: Yeah. The pillow dacked. B: Right. It dacked. Unspecified-object dialogue Example verb: eat A: Matt dacked the pillow.

- B: Really? He dacked the pillow?
- A: Yeah. He dacked.
- B: Right. He dacked.

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Gertner, Fisher, & Eisengart (2006): even before children are 2 years old, they know the subject of an English sentence should be the one doing the action (the agent)

Wugs hug blicks. (expectation: the ones doing the hugging are wugs)

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Fisher, Klingler, & Song (2006)

Noun context:

This is acorp.

Training: This is acorp (my box)!

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Fisher, Klingler, & Song (2006)

Preposition context:

This is acorp my box.

Training: This is acorp (my box)!

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Fisher, Klingler, & Song (2006)

Training: This is acorp (my box)!

At test, those trained with the noun-context (this is acorp) looked at the object match (inferred it was an object) when asked "What else is acorp?"

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Fisher, Klingler, & Song (2006)

Training: This is acorp (my have

At test, those trained with the preposition-context (this is acorp my box) looked at the location match (inferred it was a relationship between objects) when asked "What else is acorp my box?"

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Cauvet et al. 2014: 18-month-old children recognize that determiners (like *the*) precede nouns (like *ball*) and pronouns (like *l*) precede verbs (like *eat*).

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Gordon (2003): 10-month-old children are sensitive to the fact that events (which we indicate with verbs) have key participants (which correspond to subjects and objects in adult language). This is the precursor to realizing the mapping from sentence form to meaning.

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Goldin-Meadow & Mylander (1998): Children seem to naturally translate their prelinguistic understanding of events into linguistic structures. Studies of deaf children who are forced to create their own homesign systems show that they systematically use syntactic position to signal semantic roles like agent.

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Alishahi & Pyykkönen (2011): The ability to track and combine multiple contexts of a word and infer its meaning seems to work much better for verbs than for nouns, given realistic child-directed speech (the Brown corpus from the CHILDES database). A&P speculate that this may be because nouns are not as dependent on syntactic context in order to learn their meaning (for example, nouns may be observable objects).

Syntactic Bootstrapping Hypothesis: primarily using the syntactic structure to get to meaning

Braginsky, Yurovsky, Marchman, & Frank 2016: While concreteness tends to predict the age of acquisition for nouns, knowledge of linguistic structure is a good predictor for function words like *how*, *why*, and *his*. This is true across seven different languages (English, Italian, Norwegian, Russian, Spanish, Swedish, Turkish) from the Wordbank database.

http://wordbank.stanford.edu

Wordbank

An open database of children's vocabulary development

Getting a sense of how a child might feel

From But n Ben A-Go-Go, Matthew Fitt (2000), p.85

But his hert cawed him on. He nou had the information he had been tryin tae jalouse on his ain aw these years. Or pairt o it onywey. A whusper. A hauf truth. An the time had come tae mak siccar. He would meet with Broon an tak fae him whit wis needed.

Some contextual clues available (syntactic bootstrapping + known words).

Getting a sense of how a child might feel

From But n Ben A-Go-Go, Matthew Fitt (2000), p.85

But his heart called him on. He now had the information he had been trying to jalouse on his ain all these years. Or part of it anyway. A whisper. A half truth. And the time had come to make siccar. He would meet with Broon and take fae him what was needed.

Add in knowledge of "near-words" that sound close to recognizable words. Remaining: jalouse, ain, siccar, fae?

Getting a sense of how a child might feel

From But n Ben A-Go-Go, Matthew Fitt (2000), p.85

But his heart called him on. He now had the information he had been trying to jalouse on his own all these years. Or part of it anyway. A whisper. A half truth. And the time had come to make siccar. He would meet with Broon and take from him what was needed.

Guess common words by their position in the sentence (syntactic bootstrapping).

Still remaining: jalouse, siccar?

What are your guesses as to what these words mean? Why?

Lexical development recap

Children have to figure out what concept a word refers to. This may be easier for nouns than for verbs, possibly because the meaning of nouns (especially concrete nouns) is easy to observe.

Linguistic structure may be one of the more useful cues for learning the meaning of verbs. The syntactic bootstrapping hypothesis formalizes this idea.

Questions?

You should be able to do up through 14 on HW4 and up through 28 on the review questions for lexical development.

Extra Material

Children can use input to figure out which aspect of their experience is being lexicalized

"What colors are these?"

Children can use input to figure out which aspect of their experience is being lexicalized

Children can use input to figure out which aspect of their experience is being lexicalized

"a blue tray"

"a chromium tray"

Note: none of the children knew either the word "olive" as a color or the word "chromium" as a property

Children can use input to figure out which aspect of their experience is being lexicalized

"Bring me the chromium tray; not the blue one, the chromium one."

Children can use input to figure out which aspect of their experience is being lexicalized

Children learned to give the olive tray.

Children can use input to figure out which aspect of their experience is being lexicalized

5 weeks later...

"What colors are these?"

Children can use input to figure out which aspect of their experience is being lexicalized

Children can use input to figure out which aspect of their experience is being lexicalized
