

Psych 156A/ Ling 150:
Acquisition of Language II

Lecture 5
Sounds of Words

Announcements

- Be working on HW1 (due 4/17/14)
- Be working on review questions for sounds and sounds of words

Word forms

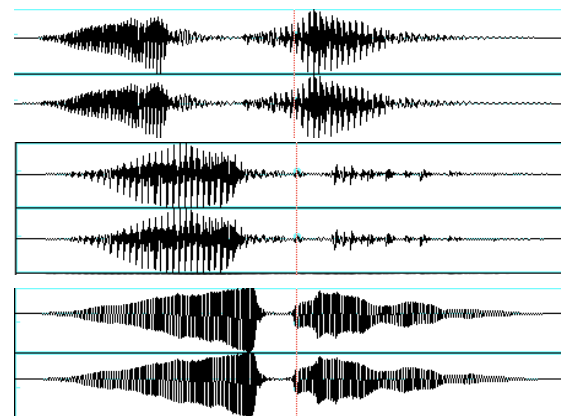

Computational problem:
Map variable word signals to more abstract word forms

What's involved in word learning

Word learning: mapping between concept, word, and word's
variable acoustic signal

"goblin"

Stager & Werker 1997

Learning nonsense words that are **minimal pairs (differ by one phoneme)**:
 'bih' vs. 'dih'. Comparing against words that are not: 'lif' vs. 'neem'

"Switch" Procedure: measures looking time

...this is a *bih*...look at the *bih*

Habituation

Same:
look at the *bih*!

Switch:
look at the *dih*!

Test

Stager & Werker 1997

Experiment 1

14-month-olds

...this is a *dih*...look at the *dih*

...this is a *bih*...look at the *bih*

Habituation

Same:
look at the *bih*!

Switch:
look at the *dih*!

Test

Stager & Werker 1997

Experiment 1

14-month-olds

No looking time difference = 14-month-olds didn't notice the difference!

Stager & Werker 1997

Experiment 2

8-month-olds & 14-month-olds

...this is a *bih*...look at the *bih*

Habituation

Same:
look at the *bih*!

Switch:
look at the *dih*!

Test

Stager & Werker 1997

Experiment 2

8-month-olds & 14-month-olds

No difference in looking time = 14-month-olds didn't notice the difference again!

Stager & Werker 1997

Experiment 2

8-month-olds & 14-month-olds

But 8-month-olds did! They have a difference in looking time. They look longer at the "bih" object when it is labeled "dih" - so they must know "b" and "d" are different.

Stager & Werker 1997

Experiment 3

14-month-olds

...this is a *lif*...look at the *lif*

Habituation

Same:
look at the *lif*!

Switch:
look at the *neem*!

Test

Stager & Werker 1997

Experiment 3

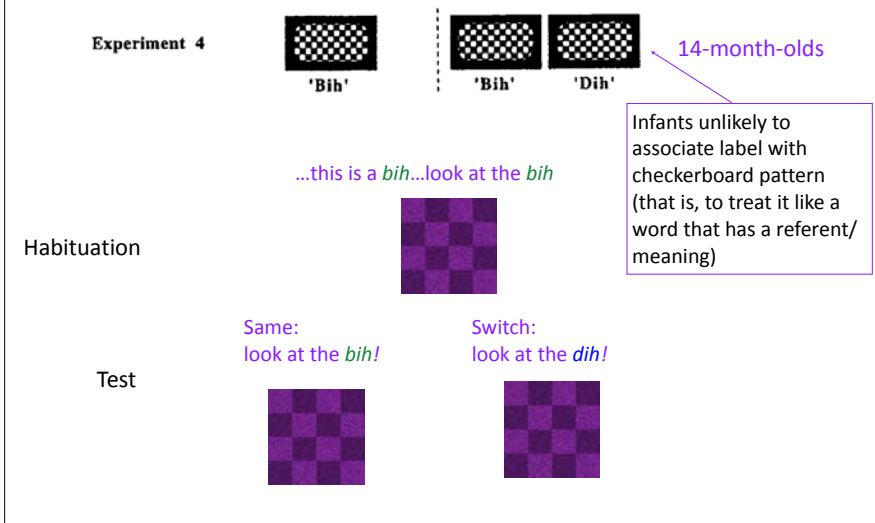

14-month-olds

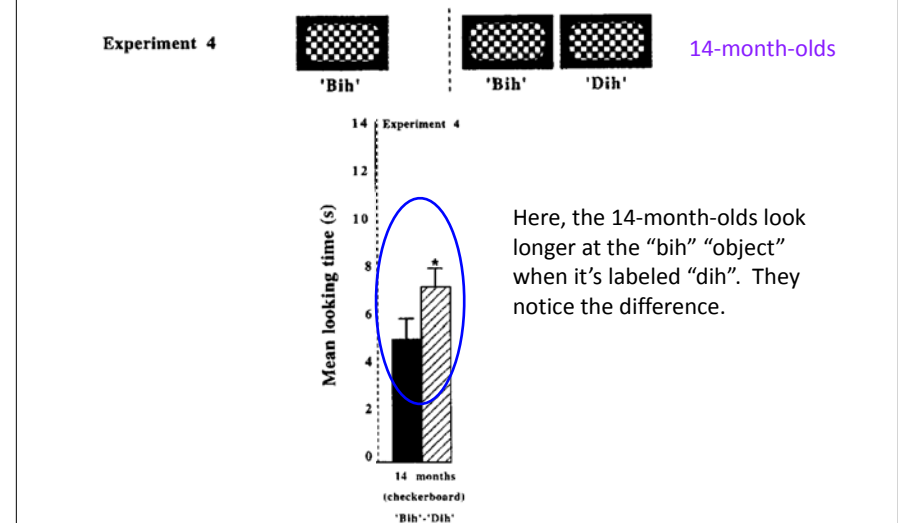

Here, the 14-month-olds look longer at the "lif" object when it's labeled "neem". They notice the difference.

Stager & Werker 1997

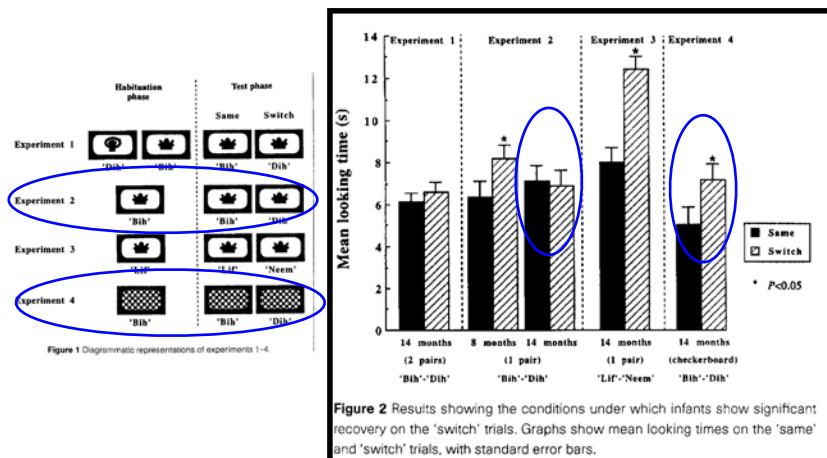

Stager & Werker 1997

Stager & Werker 1997

Key: Experiment 2 vs 4

Key findings

14-month-olds can discriminate the minimally contrasting words (Expt. 4)

...but they fail to notice the minimal change in the sounds when they are paired with objects, i.e., when they are words with associated meaning (Expt. 2)

14-month-olds can perform the task, when the words are more distinct (Expt. 3)

Therefore, 14-month-olds use more detail to represent sounds than they do to represent words!

What's going on?

They fail specifically when the task requires word-learning

They *do* know the sounds...but they fail to use the detail needed for minimal pairs to store words in memory

What's going on?

- Is this true for all words?
- When do they learn to do this?
- What triggers the ability to do this?

What children may be doing

One idea: Encode detail only if necessary

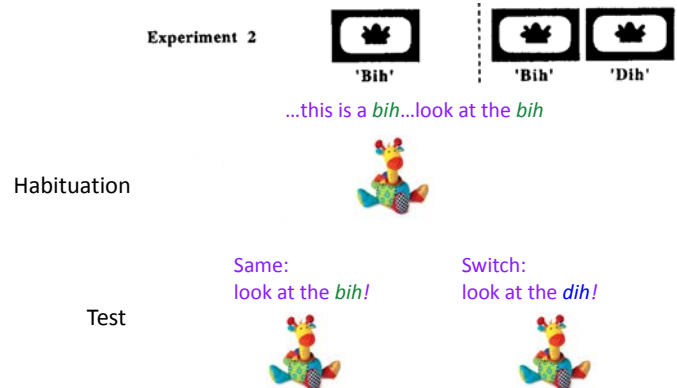

If children have small vocabularies, it may not take so much detail to distinguish one word from another. (*baby, cookie, mommy, daddy...*)

Neighborhood structure idea: When a child knows two words that differ only by a single phoneme (like "cat" and "bat"), more attention to detail is required to distinguish them.

Prediction: The content of children's vocabulary drives their ability to notice the difference between words that differ minimally (ex: by a single phoneme)

Going with the neighborhood idea, look at Stager & Werker 1997

"bih" and "dih" are too close (they differ only by one phoneme), and 14-month-old kids don't know any words close enough to motivate attention to the "b"/"d" difference when word-learning

Werker et al. 2002: Vocabulary size matters

Stager-Werker task
Test

Same:
look at the *bih*!

Switch:
look at the *dih*!

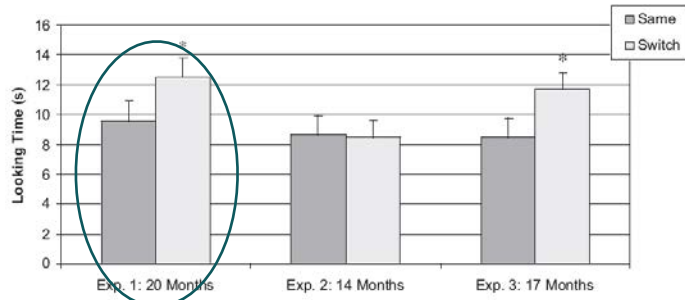

Werker et al. 2002: Vocabulary size matters

Stager-Werker task
Test

Same:
look at the *bih!*

Switch:
look at the *dih!*

20-month-olds notice

Werker et al. 2002: Vocabulary size matters

Stager-Werker task
Test

Same:
look at the *bih!*

Switch:
look at the *dih!*

14 month-olds don't

Werker et al. 2002: Vocabulary size matters

Stager-Werker task
Test

Same:
look at the *bih!*

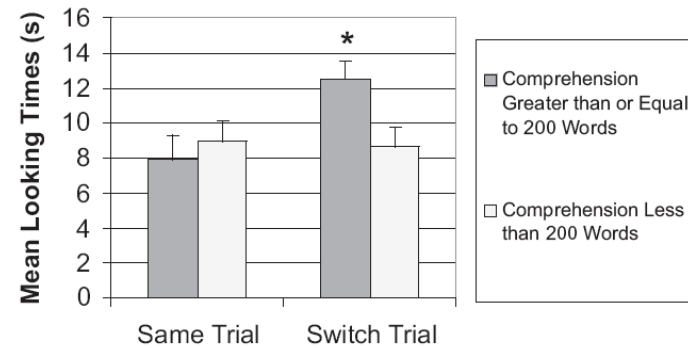

Switch:
look at the *dih!*

17-month-olds do

Werker et al. 2002: Vocabulary size matters

Zoom in on the 17-month-olds

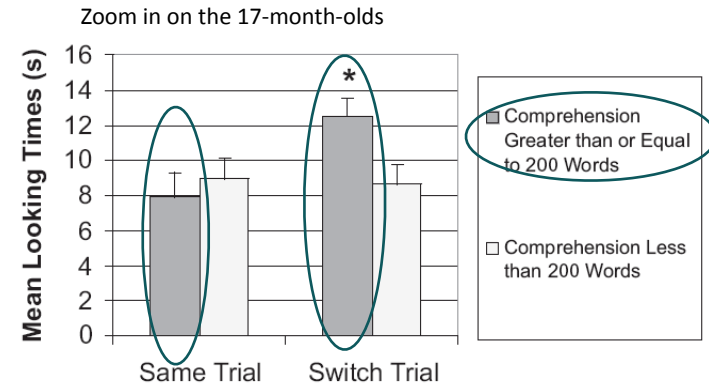

Werker et al. 2002: Vocabulary size matters

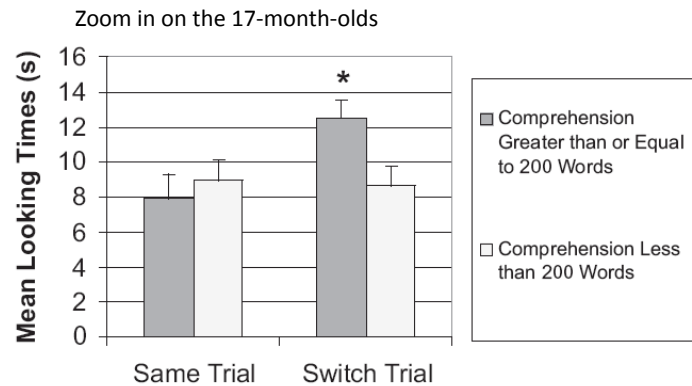

Those with a small vocabulary look like 14-month-olds - they can't tell the difference for a novel word they haven't heard much.

Werker et al. 2002: Vocabulary size matters

Those with a large vocabulary look like 20-month-olds - they *can* tell the difference for a novel word, even though they haven't heard it much.

Werker et al. 2002: Vocabulary size matters

Implication: Performance on Stager-Werker task with novel words *does* depend (somehow!) on how many words the child knows.

More vocabulary = more necessary distinctions?

Werker et al. 2002: Performance on Stager-Werker task with novel words depends on how many words the child knows.

Implication: The content of children's vocabulary drives their ability to notice the difference between words that differ minimally (ex: by a single phoneme)

Prediction: This should apply to familiar words too. Specifically, children with small vocabularies should have trouble noticing phonemic differences in familiar words.

Swingley & Aslin 2002: Familiar word tests

But English 14-month-olds noticed the difference between correct pronunciations and mispronunciations when the words were familiar!

Table 1. Correctly pronounced (CP) target words and their mispronounced (MP) versions

CP	MP-close	MP-distant
apple (/æpl/)	opple (/apɫ/)	opal (/opɫ/)
baby (/be'bi/)	vaby (/ve'bi/)	raby (/.ɹe'bi/)
ball (/bɔɫ/)	gall (/gɔɫ/)	shawɫ (/ʃɔɫ/)
car (/kaɪ/)	cur (/kɜ:/)	kier (/ki:/)
dog (/dɔg/)	tog (/tɔg/)	mog (/mɔg/)
kitty (/kɪti/)	pity (/pɪti/)	yitty (/jɪti/)

Maybe these 14-month-olds just happen to have large vocabularies?

Swingley 2005: Familiar words for younger children

(Dutch) 11-month-olds noticed the difference between correct pronunciations and mispronunciations when the words were familiar (Headturn Procedure: tests ability to hear sound differences)

Familiar	Nonword	Onset-MP
beɦn	baɦs	deɦn
beɦ	bøɦs	deɦ
bøeyk	bøeyn	køeyk
eɦnt	eɦp	eɦnt
ɦ nt	ɦaɦk	x nt
ɦaɦ	ɦeɦn	saf
ɦont	ɦo	font
ku	kus	xu
mont	maɦnt	nont
nøɦs	nut	møɦs
paɦt	pøɦnt	daɦt
pus	purt	tus
sxaɦp	sxeɦ	ɦaɦp
teɦn	to	peɦn
v s	vaɦnt	v s
vut	veɦnt	but

Swingley 2005: Familiar words for younger children

(Dutch) 11-month-olds noticed the difference between correct pronunciations and mispronunciations when the words were familiar (Headturn Procedure: tests ability to hear sound differences)

But this is before they've likely learned many words...so it probably isn't just the number of words they know (and which words they know) that drives the detailed representations of the sounds in the words.

Point: Vocabulary can't be the only thing determining children's ability to distinguish the sounds of words. So what's the problem with the 14-month-olds in the Stager-Werker task?

Was the task too hard for 14-month-olds?

Yoshida, Fennell, Swingley, & Werker (2009)

Maybe the problem with the 14-month-old infants was that the switch task was too hard - they have to be very confident that the close mispronunciation of the new word (*dih* for novel word *bih*) is not actually close enough

What would happen if we habituated 14-month-old children the usual way for the Switch procedure, but then tested them a different way that didn't require them to be as confident about the correct pronunciation of a word's form?

The Visual Choice Task “Preferential looking”

Golinkoff, Hirsh-Pasek, Cauley & Gordon 1987

A two-alternative forced choice looking task that compares visual fixations to target and distractor objects

“Where’s the dog?”

Familiar object better match for familiar word

The Visual Choice Task “Preferential looking”

Golinkoff, Hirsh-Pasek, Cauley & Gordon 1987

A two-alternative forced choice looking task that compares visual fixations to target and distractor objects

“Where’s the tog?”

Novel object is a better match for novel word form
and importantly familiar object is a poor match - infant knows familiar word.

Yoshida, Fennell, Swingley, & Werker 2009

Habituation
Trials
(maximum 24)

Novel labels

“bin”

“din”

Test: 14-month-olds
“Where’s the bin?”

14-month-old infants
look significantly more
at the correct novel
object - they do have
detail for words!

The problem with the Stager-Werker Task

Maybe the problem with the 14-month-olds in the Stager-Werker task was that they encoded the phonetic forms with **low confidence**. So, when tested on the original switch task, they didn’t have enough confidence in their representation of the novel form to realize it was the wrong label for the novel object.

Yoshida et al. 2009: “Calling a *din* object by the word *bin* is not good pronunciation to the 14-month-old, but neither is it categorically incorrect.”

Why does having a familiar word help?

Idea: Children build up more confidence in the word form the more times they hear it.

{p/b/d/g}{a/o/u}{l/r} = "pall", "dor"

... "gull", "ball"

(p/b){a}{l/r} = "pall", "ball",

... "bar", "par"

{b}{a}{l} = "ball"

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

15-month-olds learned novel names for objects that began with either [t] or [d].

dawbow vs. *tawgoo*

This was meant to draw attention to the difference between these phonemes.

Figure 1. Children's looking time to same and switch trials after exposure to *Dawbow* and *Tawgoo*. In Experiment 1, same and switch trials are *yad* versus *yat*; in Experiment 2, they are *dee* versus *tee*. Error bars indicate \pm standard error.

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

15-month-olds learned the name of a novel object, called

yad

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

Similar to the 14-month-olds in Stager & Werker 1997, when this name was switched to *yat*, they **didn't notice**.

yat

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

15-month-olds learned novel names for objects that began with either [t] or [d].

dawbow vs. *tawgoo*

This was meant to draw attention to the difference between these phonemes.

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

If they were able to represent the [d] vs. [t] distinction abstractly, *dawbow* and *tawboo* should help remind them that [d] and [t] are distinct. So, if the other novel object's name is switched from *yad* to *yat*, they should notice.

But they didn't...probably because this is a different acoustic context (word-initial vs. word-final).

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

This suggests they're representing a lot of extra contextual and perceptual detail about the [d] and [t] examples they heard, which causes them not to recognize those sounds (and the important differences between them) when they're used in the third novel word.

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

Check: When they're habituated to novel words that use the same acoustic context as the test word...

boeyad vs. *gooyat*

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

Now they do better at telling that this contrast is relevant in the same context.

Same Switch
yad vs. *yat*

Building up an abstract representation from many samples

Thiessen & Yee 2010: Early word form representations retain contextual and perceptual features associated with children's prior experience with words.

This suggests that they are detecting the difference between [d] and [t], but not at the abstract level that would allow them to recognize that difference in different acoustic contexts.

They haven't yet abstracted to the phonemic level adults use.

Recap: Sounds, words, and detail

Word-learning is very hard for younger children, so detail seems to be initially missed when they first learn words.

When children are tested with a visual choice task, they show more knowledge of detailed word forms than when they are tested with a Switch procedure task.

Many exposures are needed to learn detailed word forms at the earliest stages of word-learning, so that the word forms are represented at the appropriate abstract level.

Questions?

You should be able to do all the questions on HW1 and all the review questions for sounds & sounds of words.
